Recommendations

Lime/Aluminum Sulfate to Apply
Apply 11.5 lbs (11.5 cups) 80-89 lime/100 sq. ft. Broadcast and incorporate recommended 80-89 lime into the upper 6 to 8 inches of soil. It is impractical to adjust soil pH effectively when permanent plantings are established.

Fertilizer to Apply
Phosphate: Apply 0.5 lbs of starter turf fertilizer per 100 sq. ft to meet plant phosphate needs.
Potash: Apply 6.0 lbs of winterizer turf fertilizer per 100 sq. ft to meet plant potash needs. This amount should be split over 3 years.
Nitrogen: Apply 0.8 lbs of regular turf fertilizer per 100 sq. ft to meet plant nitrogen needs.

Most plants require at least an annual nitrogen application, but recommended phosphate and/or potash fertilizers should only be applied once (unless stated otherwise) and soils tested in 2-3 years to determine if more is needed.

Several types of general use (high nitrogen), starter (high phosphate) and winterizer (high potash) fertilizer blends are available. Avoid ‘weed and feed’ or crabgrass inhibitor types.

Use of starter and winterizer turf fertilizer will increase available phosphorus and potassium to levels optimum for plant growth and supply some needed nitrogen.

Cultural and Management Tips
If lime has been applied in the last 2 years, more lime may not be needed due to incomplete reaction.

Soil tests indicate that phosphate and/or potash fertilizers are needed. Broadcast and incorporate recommended materials into the upper 6-8 inches prior to planting or topdressing to established areas and water in thoroughly.

Improve marginal soils that may be ‘heavy’ and poorly drained, or sandy and excessively drained by adding organic materials such as compost, grass clippings, leaves, rotted manure, or peat moss. Annual applications dug into the upper 6-8 inches will maximize improvement.

Leafy vegetables, sweet corn, tomatoes, and vine crops may require additional nitrogen at flowering. Place about 1 oz (2 Tbl) urea or 4 Tbl of a high nitrogen turf fertilizer in a band at least 3 inches from the plant. Use 1.5 lbs (3 cups) urea or 3 lbs (6 cups high nitrogen turf fertilizer) for every 100 ft of row.

$P_2O_5 \& K_2O$ or P & K

- Grades for P and K are expressed as oxides, rather than on elemental basis
- Fertilizer recommendations are also given on oxide basis
  - lbs $P_2O_5$ / 100 ft$^2$ or 1000 ft$^2$
  - lbs $K_2O$ / 100 ft$^2$ or 1000 ft$^2$
- P and K in fertilizer not actual present as $P_2O_5$ or $K_2O$
  - Plants do not actually use $P_2O_5$ or $K_2O$
  - Oxide forms are used only to indicate amounts of P and K in fertilizer

Fertilizer Grades Example

- Useful in determining application rates
- Minimum guaranteed amounts of available N, P$_2$O$_5$ and K$_2$O in fertilizer

30 – 3 – 3

N – P$_2$O$_5$ – K$_2$O

Calculated on a % of total weight basis
Fertilizer Types

• Mixed Fertilizer – contains more than one of the three major nutrients (ie 18-46-0)
• Complete Fertilizer – contains all three of the major nutrients (ie 6-24-24)
• Straight Fertilizer – contains only one of the three major nutrients (ie 46-0-0)
Examples of Various Types of Lawn Fertilizers

• Regular or High Nitrogen (N)
  – 30-3-3, 27-3-6, 19-4-4,
• Starter or High Phosphate (P2O5)
  – 9-19-9, 17-26-6, 9-13-7
• Winterizer or High Potash (K2O)
  – 10-16-20, 22-4-14
What is Needed

- **Phosphate Recommendation** – 0.5 lbs starter turf fertilizer per 100 sq. ft. (apply once)
- **Potash Recommendation** – 6.0 lbs winterizer fertilizer per 100 sq. ft. (split over 3 years)
- **Nitrogen Recommendation** – 0.8 lbs regular turf fertilizer per 100 sq. ft. (apply annually)
What is Needed

• Lime Recommendation – 11.5 lbs (cups) 80-89 grade Aglime per 100 sq. ft. (apply once)
  Allow three years to fully equilibrate
• Retest in about three years.
Summary

• Take a good (representative) soil test
• Apply lime and fertilizer as needed
• Use a readily available nutrient source to meet the requirements indicated on the report
